Smoking around oxygen is extremely dangerous and may cause clothing and hair to catch fire and burn much more vigorously than in air.

Never smoke or allow someone else to smoke nearby whilst using your oxygen equipment.

The picture above shows facial burns on a patient who lit a cigarette whilst using oxygen therapy.

Oxygen enrichment

Your clothing could become enriched with oxygen as you use your medical oxygen. Clothing and materials which become enriched with oxygen will burn vigorously if ignited. Your clothing will continue to be enriched, even after you have turned off your oxygen supply.

Make sure you ventilate your clothing in the open air for at least 20 minutes before smoking or going near an open flame or source of ignition.

Oils and grease

Oils, grease and materials contaminated with these substances are particularly hazardous in the presence of an oxygen enriched atmosphere, as they can ignite extremely easily and burn very violently.

- Ensure that your hands are clean and do not use oil-based creams and moisturisers when using your medical oxygen system. This includes the use of oil-based lip moisturisers and make up.
- If using alcohol gel, please ensure that it is massaged in well, particularly between the webbing of fingers and allow time for evaporation to take place before handling oxygen equipment.
- Do not use oils or grease with your oxygen equipment.
- Use water-based products such as KY Jelly.

Other hazards

- Do not use aerosols such as hair sprays or deodorants whilst using your oxygen equipment.

Electronic Cigarettes

Recent innovations in smoking cessation programmes have led to the introduction of so called “electronic cigarettes”. These work on the principle of a heating element that vaporizes a liquid solution which delivers nicotine.

Electronic cigarettes include a power source, and this may be charged from a USB power port or by using a separate battery charger. These items when saturated with oxygen may ignite.

It has been reported that there could be a risk of an ignition of an electronic cigarette whilst a patient is undergoing oxygen therapy.

As a result, electronic cigarettes should **NOT** be used whilst on oxygen therapy.

Additionally, batteries of electronic cigarettes should not be charged in the vicinity of a patient undergoing oxygen therapy or the oxygen source itself.

If you are using electronic cigarettes you should follow the same safety principles adopted when smoking burning cigarettes.
